

Week 12 Completion Status:

- Drafted Part II of the research manuscript: Evaluation & Results, Discussion & Limitations, and Conclusion.
- Inserted the final data tables and terminal logs into the Overleaf document to support the findings.
- Conducted a comprehensive audit of the project's GitHub repository to guarantee reproducibility.
- **In Progress: Currently building the final presentation deck.**
- Git link: <https://github.com/scr200/CP395-Research-Project>
- **Manuscript (overleaf link):**

Methodology/Changes:

This week was dedicated to drafting the second half of the paper and starting to package the project for grading. I focused the "Evaluation & Results" section on the hard numbers: highlighting how the proposed AIOps system reduced SLA violations from 14.2% down to 2.1%. I also wrote a detailed "Discussion" section focused entirely on the ablation study, explaining how removing the Python guardrails caused resource waste to catastrophically spike to 48.7%.

I also spent significant time auditing my GitHub. I updated the README.md to explicitly separate "Phase 1: Baselines" and "Phase 2: LLM Evaluation," ensuring anyone cloning the repo knows exactly which Python scripts to run to reproduce my results.

I am currently working on drafting the presentation slides. I've decided to keep text to an absolute minimum and rely on the figures I generated throughout the semester to tell the visual story.

Issues/Risks/Mitigations:

- I am designing the slides to abstract the heavy math out of the verbal presentation (leaving it in the paper for the grader) and instead focusing the presentation on the *results* and the *ablation study*. Highlighting how the LLM panicked and tried to set a 40% threshold during Scenario 8 makes for a much more engaging and easily understood presentation.
